i-move: A Premium Experience and a Convenient Luxury

i-move conveys to the driver and passengers a genuine premium experience. Thanks to i-move, with the mere press of a button the door moves silently buzzing towards the car, and then securely closes with a cushioned sound. Due to high production costs previous cinching systems were only available in the luxury class where such an expensive feature was not inappropriate in relation to the total cost of the car. i-move offers a new low-cost and innovative option which now makes fitment possible in all other car classes.

A sensible solution for many situations

The concept of i-move is not restricted to luxury applications. An intensive study of the lifestyles of i-move target customers has revealed considerable practical advantages to them in the everyday use of the car. The i-move offers a valuable and substantial increase in comfort for drivers and passengers with limited limb movement, medical ailments such as back problems, children, pregnant ladies and the elderly.

State-of-the-art door controlled opening technology

In confined spaces opening a conventional door can result in damage to the outer edge of the door surface. This is because a conventional door has an intervalled door holding mechanism. To prevent the hitting of adjacent cars or a wall, the driver or passenger is forced to hold the door while leaving the car.

In addition to advanced locking technology, i-move technology incorporates a feature which holds the door securely at any position desired by the driver and passenger. This relegates to history the knocks and dents associated with getting in and out of the car in awkward and confined spaces. This saves a lot of trouble and expense.
