

## i-access

### Keyless entry comfort for the driver

**i-access** is a keyless car entry system for drivers. As with traditional keyless systems, the need for a key or remote control to open the door is eliminated.

The benefit of **i-access** in comparison to the systems currently available on the market is the significantly reduced system complexity, the elimination of additional assembly effort as well as the lower price.

#### Functionality

The outer door handle is pulled once to »wake« the system. The electronic integrated into the latch sends out a wireless query whether the right key is in the vicinity.

If a match is found, then the latch is immediately unlocked. If connected to a Kiekert central locking system, all of the car's doors can be opened simultaneously. The entire process takes place unobtrusively within milliseconds.

#### Benefits for the OEM

- **No additional assembly effort**
  - Plug & play solution without engagement into system architecture
  - No cable connection to Body Control Unit (BCU) required
- **System complexity reduction**
  - Complete system integration into the door latch
  - Outside door handle, BCU and receiver from current »key fob« applications are used
- **Cost reduction**
  - No cost-intensive sensors and controllers
  - No specific keyless door handle
  - No interior monitoring

#### Cooperation for successful innovation

i-access combines the electronic expertise of Continental and Kiekert's experience in the area of closing systems. Together, they represent a new level of entry comfort for the mass market.

#### Benefits for the consumer

- **Keyless entry comfort**
- **Quick and easy access to the vehicle**
- **No annoying looking for keys to unlock the doors** (e.g. during rain or when hands are fully loaded)
