

i-move

The electrical actuator for all side doors

Premium comfort at the touch of a button. With the flick of a switch, the user instructs **i-move** to close the door by drawing the opened vehicle door onto the car body.

The doors can be locked either manually or with the assistance of a power closing latch (e.g. Kiekert's **i-close**).

Benefits for the OEM

- Affordable, platform-independent premium feature
- Plug & play after-market solution
- No antipinch protection required
- Does not affect the OEM assembly process – the integrated stepless doorstop replaces the existing door stay hinge

Benefits for the consumer

- Premium feel from the moment you climb in – the door closes very conveniently
- When fully opened, car doors with a large opening angle often have an uncomfortable distance to the handle and may even represent a risk for children and older people due to the need to lean far out.
- The integrated stepless doorstop in i-move stops the door at any angle. This protects the paintwork in tight parking spaces. Even when the car is parked on an inclination or in the wind, the position of the door remains fixed.

Kiekert offers i-move in two different versions

- **Basic version**
 - Automatic draw-in of the door to the safety stop (20° opening angle)
 - Integrated stepless doorstop
 - Closing time: 5 seconds
 - Operating current <8A
- **Optional**
 - Remote controlled closing of the door
 - Automatic closing of the door through combination with Kiekert's i-close power closing latch
 - Integrated electronic
